# 1 Agenda

## 1.1 Minimum Spanning Trees

- Edge-weighted graphs
- Definition of MST, Example
- Cuts and cut-sets
- Kruskal's algorithm
- Prim-Jarnik algorithm

## 2 Edge-Weighted Graphs

- A graph  $G = (V, E, w)$  where  $w : E \rightarrow \mathbb{R}$  assigns a real weight to each edge.
- The **weight** of a set of edges  $F \subseteq E$ :  $w(F) = \sum_{e \in F} w(e)$ .

## 3 Spanning Trees

Given a connected undirected graph  $G = (V, E)$ :

- A **spanning tree** is a subgraph  $T = (V, E')$  that is a tree (connected and acyclic).
- Any spanning tree has exactly  $|V| - 1$  edges.
- Removing any edge from a spanning tree disconnects it; adding any non-tree edge creates exactly one cycle.

## 4 Minimum Spanning Tree

Given a connected edge-weighted graph  $G = (V, E, w)$ , a **minimum spanning tree** is a spanning tree  $T^*$  that minimizes total weight:

$$T^* = \arg \min_{T \text{ spanning tree}} w(T).$$

## 4.1 Example

Vertices: {a, b, c, d, e}

Edges: (a,b):3 (a,c):1 (b,c):4 (b,d):2 (c,d):5 (c,e):6 (d,e):7

MST edges: (a,c):1, (b,d):2, (a,b):3, (c,e):6 [total = 12]

## 5 Cuts and Cut-Sets

### 5.1 Cut

A **cut** of  $G = (V, E)$  is a partition  $(S, V \setminus S)$  where  $\emptyset \subsetneq S \subsetneq V$ .

### 5.2 Cut-Set

The **cut-set** (crossing edges) of cut  $(S, V \setminus S)$ :

$$E(S, V \setminus S) = \{(u, v) \in E \mid u \in S, v \in V \setminus S\}.$$

### 5.3 Key Fact

Every spanning tree  $T$  contains at least one edge from every cut-set. (Removing all cut-set edges disconnects the graph, so any spanning subgraph must keep at least one.)

## 6 Kruskal's Algorithm

### 6.1 Idea

Greedily add the cheapest edge that does not form a cycle.

### 6.2 Pseudocode

KRUSKAL( $G, w$ )

1.  $A = \{\}$
2. for each vertex  $v$  in  $G.V$
3.     MAKE-SET( $v$ )
4. sort edges in  $E$  by weight (non-decreasing)
5. for each edge  $(u, v)$  in  $E$  (in sorted order)
6.     if FIND-SET( $u$ )  $\neq$  FIND-SET( $v$ )
7.          $A.insert((u, v))$
8.         UNION( $u, v$ )
9. return  $A$

### 6.3 Trace on Example

Process edges in order: (a,c):1, (b,d):2, (a,b):3, (b,c):4, (c,d):5, (c,e):6, (d,e):7

- Add (a,c):1 — no cycle.
- Add (b,d):2 — no cycle.
- Add (a,b):3 — no cycle.
- Skip (b,c):4 — would form cycle a-b-c-a.
- Skip (c,d):5 — would form cycle a-b-d-c-a.
- Add (c,e):6 — no cycle. Now  $|A| = 4 = |V| - 1$ . Done.

## 7 Prim-Jarník Algorithm

### 7.1 Idea

Grow a tree from an arbitrary root by always adding the cheapest edge leaving the current tree.

### 7.2 Pseudocode

```
PRIM(G, w, r)
1. for each u in G.V
2.     u.key = infinity
3.     u.parent = NIL
4. r.key = 0
5. Q = G.V // min-priority queue keyed by u.key
6. while Q != {}
7.     u = EXTRACT-MIN(Q)
8.     for each v in G.Adj[u]
9.         if v in Q and w(u,v) < v.key
10.            v.parent = u
11.            v.key = w(u,v) // DECREASE-KEY in Q
```

At termination, the MST edges are  $\{(v, v.\pi) \mid v \neq r\}$ . Note  $v.\pi$  and  $v.\text{parent}$  are used interchangeably.

### 7.3 Invariant

Let  $S$  = vertices already extracted from  $Q$ . The edges  $\{(v, v.\pi) \mid v \in S \setminus \{r\}\}$  form an MST of  $G[S]$ .  $v.\text{key}$  = minimum weight of any edge from  $v$  to a vertex in  $S$  (or  $\infty$  if none).

## 8 Questions

- How do we prove correctness of Kruskal's and Prim-Jarník? (Next lecture: Cut Property.)
- What data structures are used for MAKE-SET / FIND-SET / UNION? (Lect 29: Union-Find.)
